Personal Summary

Probably not the most interesting man in the world but self-starter, motivated, entrepreneur, family oriented, with a slight case of attention deficit disorder, might describe me pretty well. By the way, the ADD is a good thing. I always like to learn new things that can provide value to the companies I work for and to myself.

With my MBA and diverse background working in both development and quality assurance, I plan to lead in any position that I am placed. Management is not about knowing everything and having power but more about knowing the strengths of your team and using those strengths.

Work Experience

Software Quality Assurance Analyst/Manager

Unicity International, Full-Time

MARCH 2014 - PRESENT

I was brought on to start a QA department for Unicity. As a contractor previously for Unicity, I proved that I could learn new systems very quickly and work with anyone effectively. I was offered the position without a normal interview process. I was charged with working with several teams to meet their testing needs. Being only one person, I have had to enlist the help of various people in the IT department and throughout the com-

- HTML, CSS, PHP, Javascript, SQL, & Git
- Angular, Protractor, Karma, & Selenium
- Web & Mobile
- Agile & Pivotal Tracker

Implementation Specialist

InsideSales.com, Full-Time

MAY 2013 - MARCH 2014

As an implementation specialist I wrote clean custom javascript and php code to implement custom features for our SAAS platform. We worked in a team of 6 using Agile principles to manage our work flow. We integrated into the APIs and created custom pages for our clients and also pages for internal use.

- HTML, CSS, PHP, & Javascript
- Agile & Scrum
- Certified on InsideSales.com Software

Web Contractor

Unicity International, Full-Time

DEC 2012 - MAY 2013

I was fortunate enough to find a job as a contractor for Unicity which was more of an internship as I dove into the programming and IT world. I was able to learn a mountain of knowledge while creating several stand alone pages using HTML, CSS, PHP, and Javascript. I also helped make changes to their corporate wordpress site which was being transitioned over to wordpress from Joomla. So I was able to use both technologies in the process.

- HTML, CSS, PHP, Javascript, & Git
- Wordpress, Joomla, & Stripe

Technical Skills

HTML & CSS

I have worked on various projects using HTML and CSS, from projects that already had an established code base to projects that were started from scratch. There are always new challenges with every project and I am very capable of learning and understanding new concepts but always like to take advantage of work that has already been done such as templates and open source projects.

Javascript & Angular

I have been a part of many javascript projects. Angular has been an exciting and fairly new technology that has really changed the way people are writing applications. I have mostly been on the side of testing these application but am fully able to understand Angular and have often played with Angular on the side.

Protractor, SauceLabs, & Selenium

Currently I am working on writing end to end tests using Protractor and integrating those test with Sauce Labs. These tests run on over 50 platform/browser combinations, including iOS and Android, automatically when pushed to Github and then compile using jenkins.

Automation has always been a fun and exciting world for me, to be able to code something once and have it save time, over and over again is awesome but I believe that not everything should be automated because sometime the cost out weighs the benefits.

Education

Keller Graduate School of Management

Masters of Business Administration

While working as an accountant and starting several small businesses, I was also going through an online MBA program with Devry University. I knew that no matter what I did for a career an MBA would be useful and indeed it has. Now that I am working in the IT world, I find that good management is essential to the software development life cycle.

Utah Valley University

Bachelors of Science - Accounting

Growing up I thought I wanted to work on wall street so I studied figured Accounting. I thought well my Dad graduated in finance and my Brother was a CPA, so this degree whould be a great fit for me. After 4 years of tough and monotonous classes I graduated only to later realize that I can't stand being an accountant. It was just not for me, mean while I was finishing my MBA.
